Involute Splines Rudolf Och Frenco, Altdorf, West Germany Gears and Splines Engineering design requires many different types of gears and splines. Although these components are rather expensive, subject to direct wear, and difficult to replace, transmissions with gears and splines are required for two very simple reasons:

Involute spline shafts and bushings are thermal refined to have good abrasion-resistance. Spline bushings may be made in CAC (bronze) type material as a special custom order item. The surface strength of Spline The design concept of the spline surface strength is the same as that of a key. Here is the formula for the allowable transmission

2128 INVOLUTE SPLINES Diametral Pitch (P) is the number of spline teeth per inch of pitch diameter. The diametral pitch determines the circular pitch and the basic space width or tooth thickness. In conjunction with the number of teeth, it also determines the pitch diameter.

involute gear, the profiles of the teeth are involutes of a circle. (The involute of a circle is the spiraling curve traced by the end of an imaginary taut string unwinding itself from that stationary circle.) In involute gear design, all contact between two gears occurs in the same fixed, flat plane
