Heterocyclic compounds may be classified as aliphatic and aromatic heterocycles. The aliphatic heterocycles are the cyclic analogues of amines, ethers and thioethers and their properties are influenced by the ring strain. The three and four membered aliphatic heterocyclic rings are more strained and reactive compared to five and six membered rings.

Nomenclature of Heterocyclic Compounds

Heterocyclic compound. Heterocyclic chemistry is the branch of organic chemistry dealing with the synthesis, properties, and applications of these heterocycles. Examples of heterocyclic compounds include all of the nucleic acids, the majority of drugs, most biomass (cellulose and related materials), and many natural and synthetic dyes.

Heterocyclic compound - Wikipedia

The basic principles governing the degree and type of reactivity shown by aromatic heterocyclic compounds are similar to aliphatic and benzenoid chemistry. Aromatic compounds tend to "revert to type," i.e., return to their initial system of unsaturation, if disturbed.
